

Load Balancer Simulation Report

Simulation sim-test - 2026-09-21T02:44:49 - algorithm round_robin - 100 requests in 12.5s

Health check: tcp every 5.0s, fall 3 / rise 2.

Traffic Distribution

Backend	Mode	Requests	Share	Final state
web-a	healthy	0	0.0%	UP
web-b	healthy	0	0.0%	UP

State Transitions

Time	Backend	Change	Reason
t1	web-b	UP -> DOWN	fall_threshold

Simulation only - backends are in-process mock objects and no packets were sent. Round-robin distributes evenly across equal-weight healthy backends; weighted WRR scales by weight; least-connections balances active load; ip-hash provides session affinity per client IP.
